## 1. True or False

a)/In a virtual-circuit packet-switched network, a packet switch maintains state information for each connection passing through the switch.

b) ADSL and cable modem access providers must install a modem in their offices for each individual subscriber unlike the case of dial-up connections where the modems are located at the user sites only

An even parity can detect all even number of errors but it can't detect odd number of errors

(d) An "ARP request" is sent by device A to a specific device B located on the same network, to get the MAC address of B.

Two distinct web pages say <a href="http://www.usc.edu/exam.html">http://www.usc.edu/exam.html</a> and http://www.ucla.edu/grade.html can be sent over the same persistent TCP connection

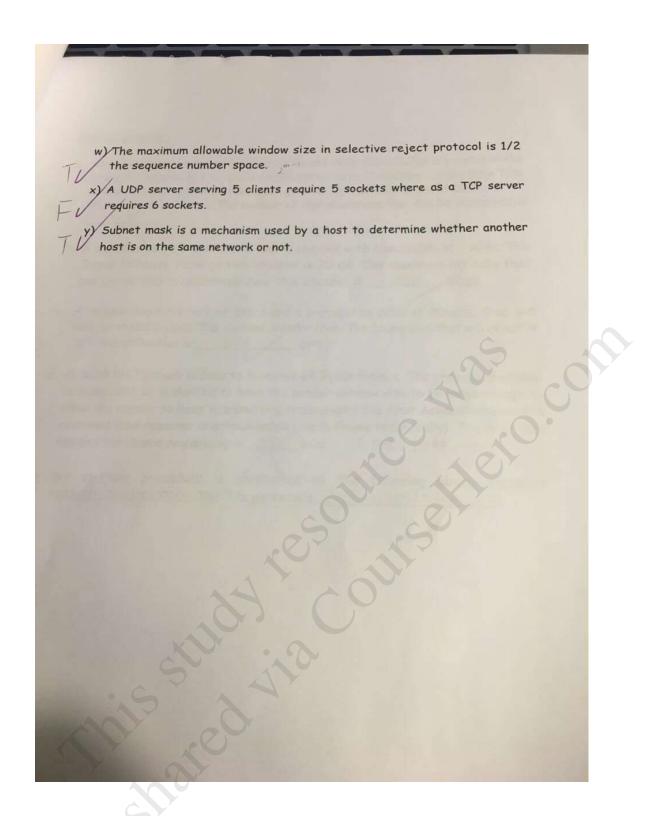

A router is a node that can forward packets that are not explicitly addressed to it.

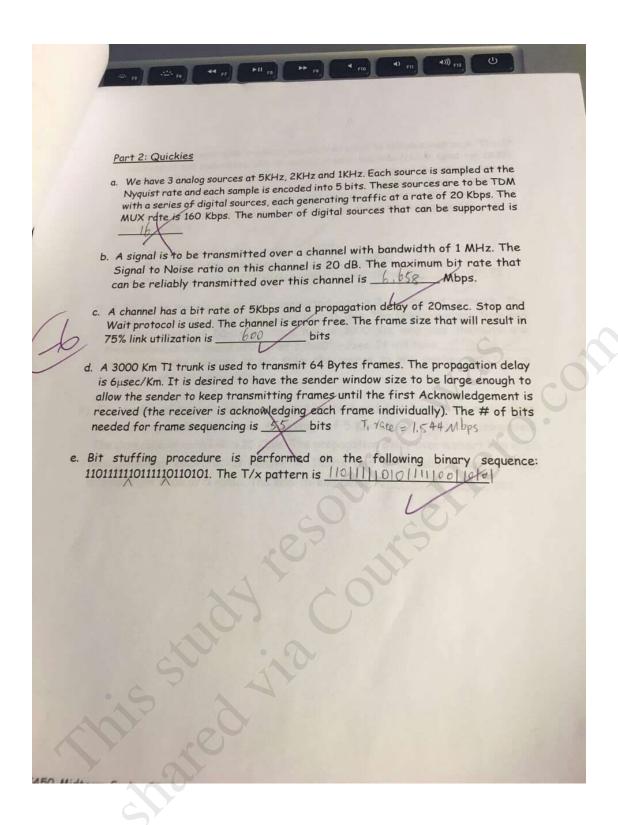

- g) A process C running in a server has a port number of 30. Two hosts A and B each send a UDP datagram to host C with destination port number 30. Both of these datagrams will be directed to the same socket.
- h) Two sockets form a bi-directional communications path between two applications
- i) /In Statistical TDM, the number of time slots in each frame is less than the number of input lines to the MUX.
- i) If a computer has multiple Network Interface Cards, The DHCP process must occur separately over each interface to obtain a separate dynamically assigned IP address for each interface.

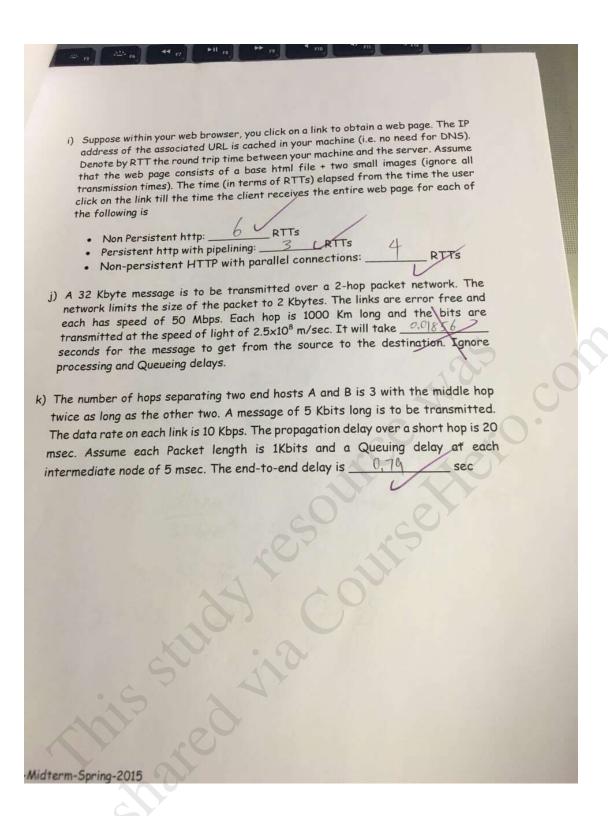

E450-Midterm-Spring-2015

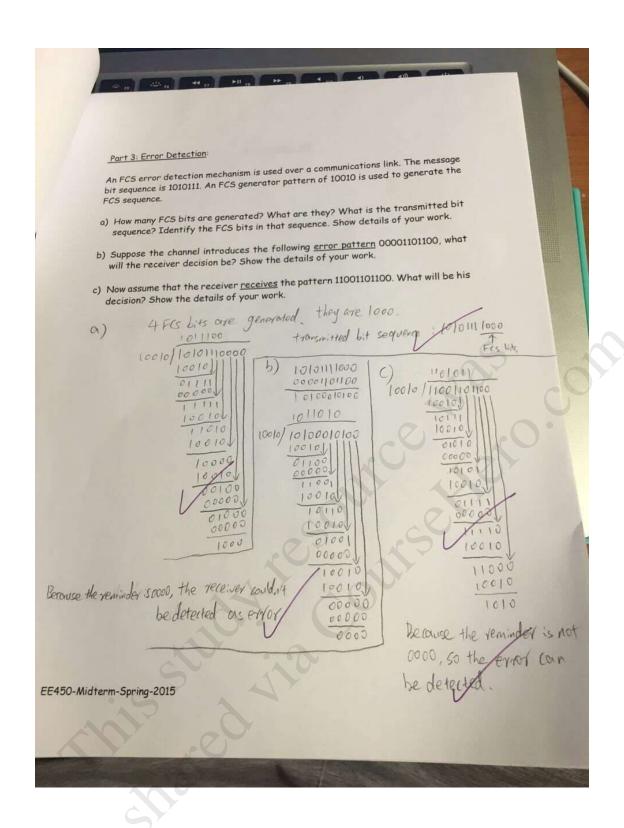

- k) Applications using UNIX Sockets allow users to specify destination hosts by their names or IP addresses.
- DNS response is classified as un-authoritative if it comes from the cache memory of the local DNS server
- m) SMTP is a protocol that allows clients to retrieve their e-mails from their mail
- n) Longer frames suffer from longer propagation delays than shorter
- o) a connection-oriented iterative server can handle multiple clients - simultaneously
- p) The "Bind" call adds the local socket address to an already created
- a) A host that needs to map a name to an IP address would call a DNS client called a "Resolver".
- r) In Go-Back-N ARQ, if the window size is 63 then the range of sequence I number is 0 ~ 64
- s) DHCP is rarely used to assign IP addresses to servers as servers rarely
- t) A server program, once it issues a passive open, waits for clients to request its services.
- u) To use a proxy server, the client must be configured to access the proxy instead of the target server.
  - v) On a single LAN, a host would use the MAC address of another host to determine whether the other host is located on the same network or not.

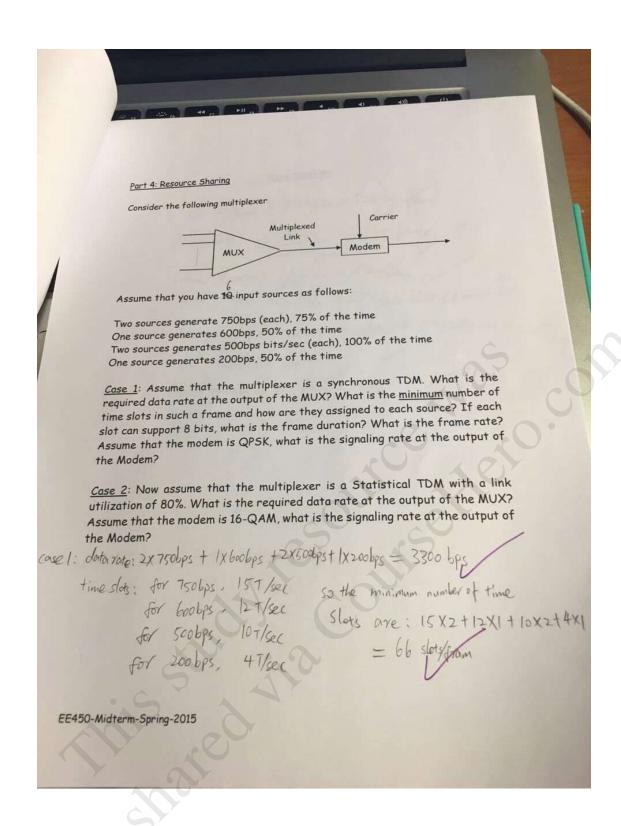

E450-Midterm-Spring-2015

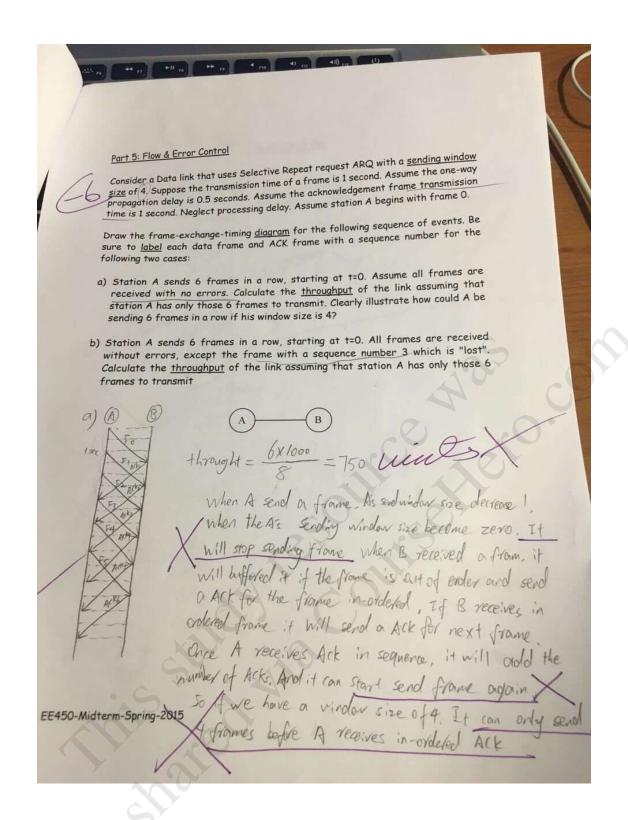

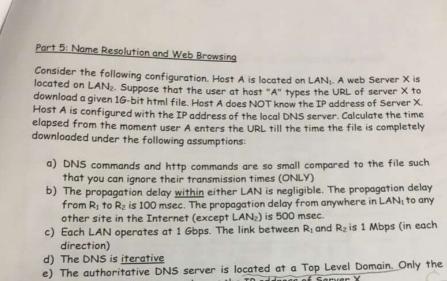

authoritative DNS server knows the IP address of Server X.

f) DNS runs over UDP where as http runs over TCP.

Create a table that identifies the steps taken (in order) along with the time
